## **Delta Hybrid Servo Drive VFD-VJ Series Servo Motor MSJ/MSO Series**

Hydraulic systems have been widely adopted as control systems for injection molding machinery, featuring high power density, excellent pressure and flow control, long service life design, and easy maintenance. A hydraulic system using an AC servo drive provides a fast response rate, higher duplication accuracy and constant torque to the system. It is a perfect integration of servo drive, motor and hydraulic technology. With precise control of pressure and flow, the hybrid servo system eliminates the energy waste to save the cost of proportional valves for pressure flow control, and improves the control system for injection molding machinery, enhancing market competitiveness.

With years of commitment to the plastic and rubber industries, Delta has developed the Hybrid Servo Drive VFD-VJ Series with superior drive performance and system integration capabilities. Compared with other products on the market, Delta's VFD-VJ Series features excellent overload capability and high power density, enabling users to choose suitable models with less power for efficient cost saving. The VFD-VJ-C Series supports IPM motor parameter self-learning and various protection functions. For applications, it provides fan-cooled and oil-cooled types, enabling stable operations for a variety of environments and conditions.

# Model Explanation of Hybrid Servo Drive

Low System Temperature

Long Pressure Holding Time

Easier Communication Integration

Good Pressure Response

Ultra Energy-Saving

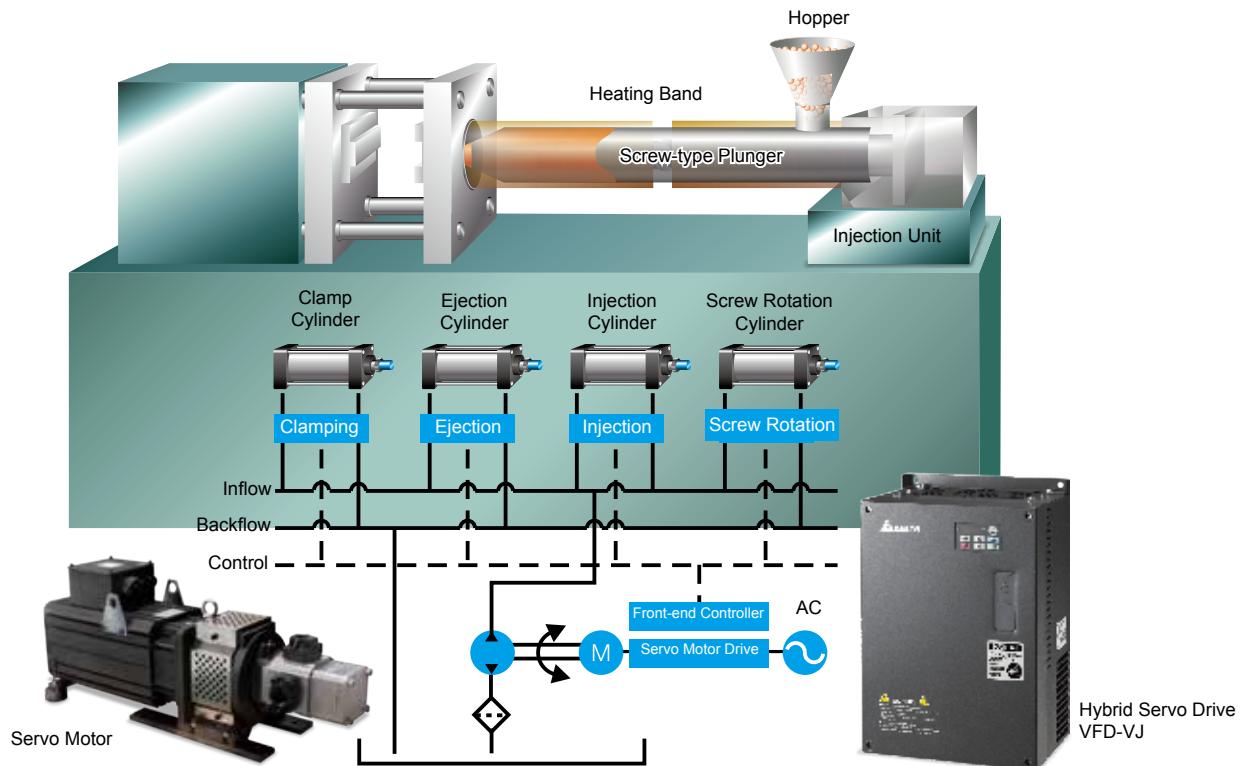

Highly Accurate Repeatability

High Durability  
\*Oil cooled type

Various Protection Functions

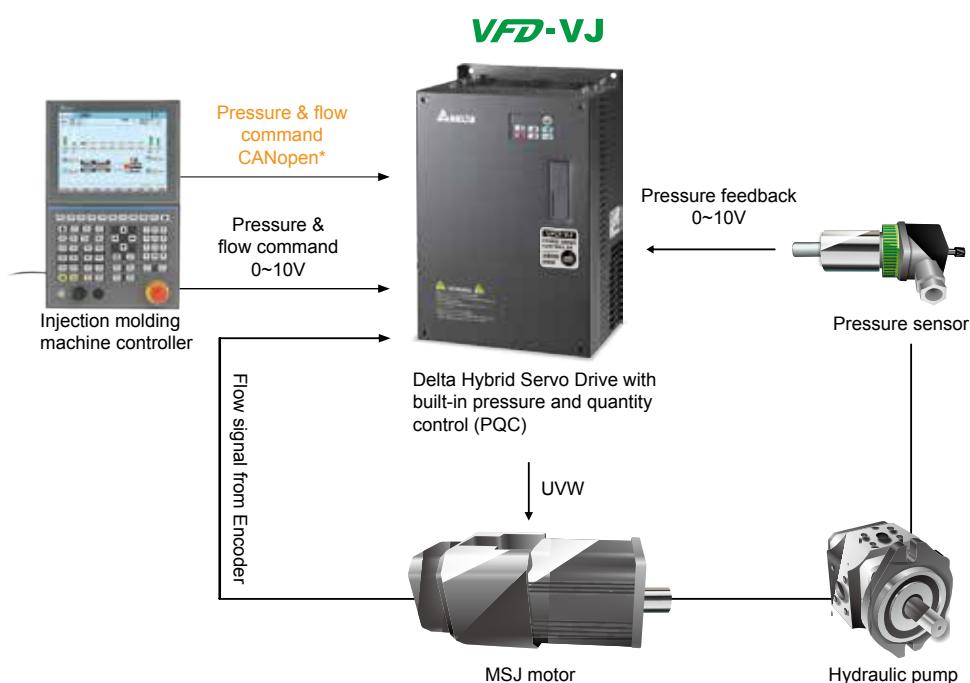

# Injection Molding Machine with Hybrid Servo System

## Structure of the Hybrid Servo System

After receiving pressure and flow commands from the injection molding machine controller, the VFD-VJ performs PID calculations with actual pressure and speed feedback to drive the servo motor and hydraulic pump with a quick response time and high repeatability.

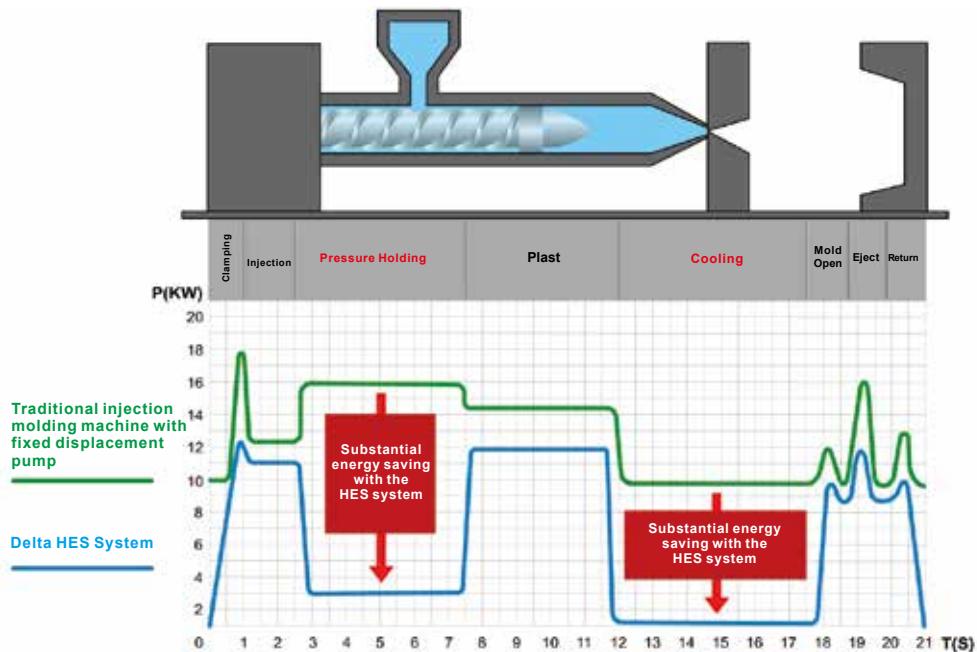

\*For VFD-VJ-C Series only

# Hybrid Energy System Features

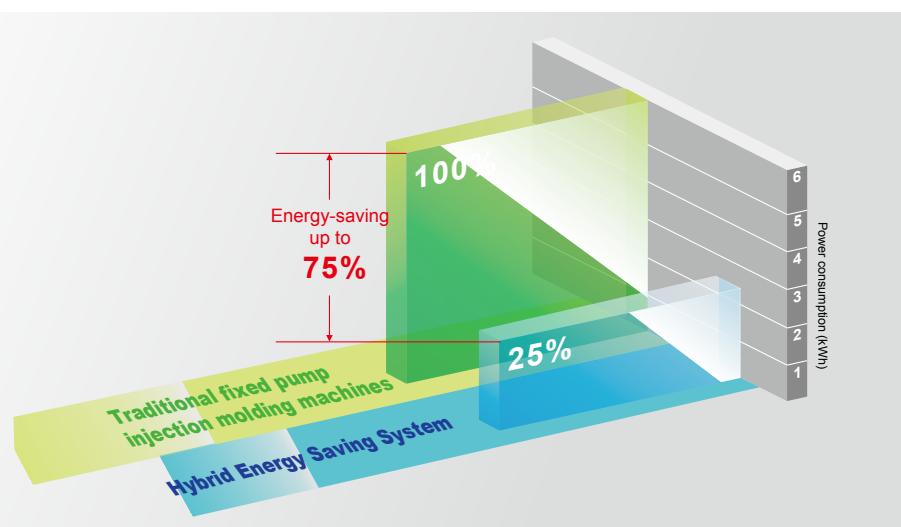

## (1) Significant reduction in energy consumption

- Saves up to **60%** electricity compared to traditional injection molding machines (fixed displacement pump) during pressure holding and cooling processes

Energy-consumption curve during injection molding

- Traditional injection molding machine uses a relief valve or proportional valve to control the pressures and the flows during mold closing, injection, pressure holding and mold opening, while the Delta HES system enables automatic adjustment according to different injection conditions, reducing up to **75%** in energy consumption.

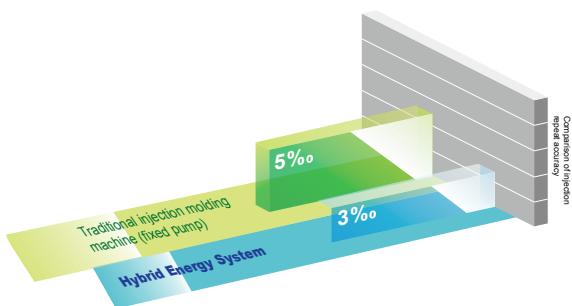

# Hybrid Energy System Features

## (2) Low system temperature

Lowers oil temperature by 5~10 °C and saves costs on oil cooler

## (3) Highly accurate repeatability

Precise flow and pressure control

## (4) Long pressure holding time

Benefits of thicker-walled parts and complex parts with both thick and thin walls

## (5) Easier communication integration

Supports CANopen communication protocol for data transmission

## (6) Fast frequency response

High dynamic performance (ability to respond and control pressure and velocity changes) is suitable for high-speed injection molding machines.

## (7) Good field-weakening control

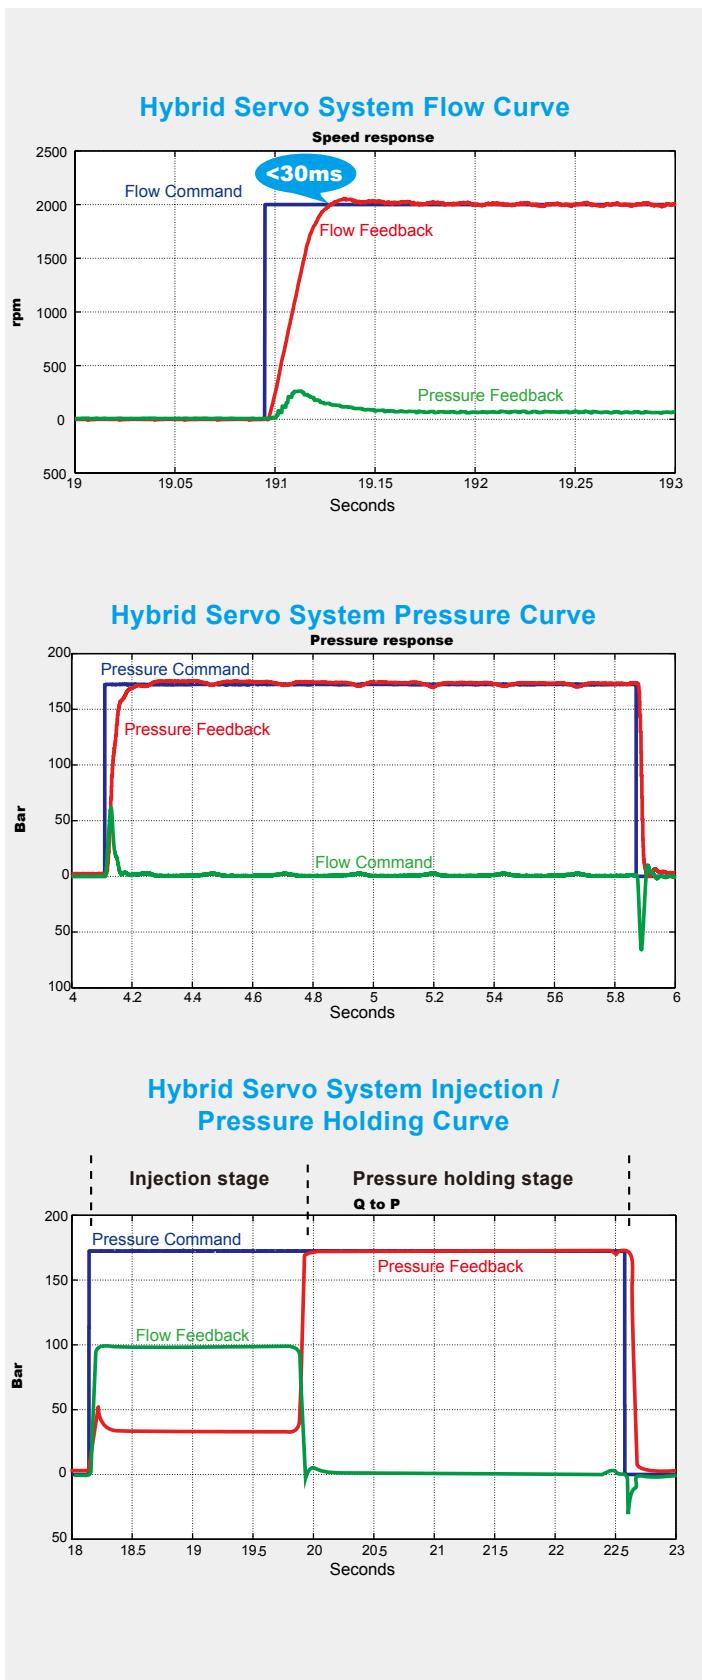

Increases output voltage, decreases output current and maintains sine wave output to reduce motor damage and vibration

## (8) Easy to use (VFD-VJ-C Series)

Provides 5-digit LED keypad and left shift button to increase operational convenience

## (9) Multiple protection functions

# Specifications

## Fan Cooled Type (VFD-VJ-A / VFD-VJ-B Series)

\* Currently obtaining UL certification for the 230 V model of the VFD-VJ-C Series.

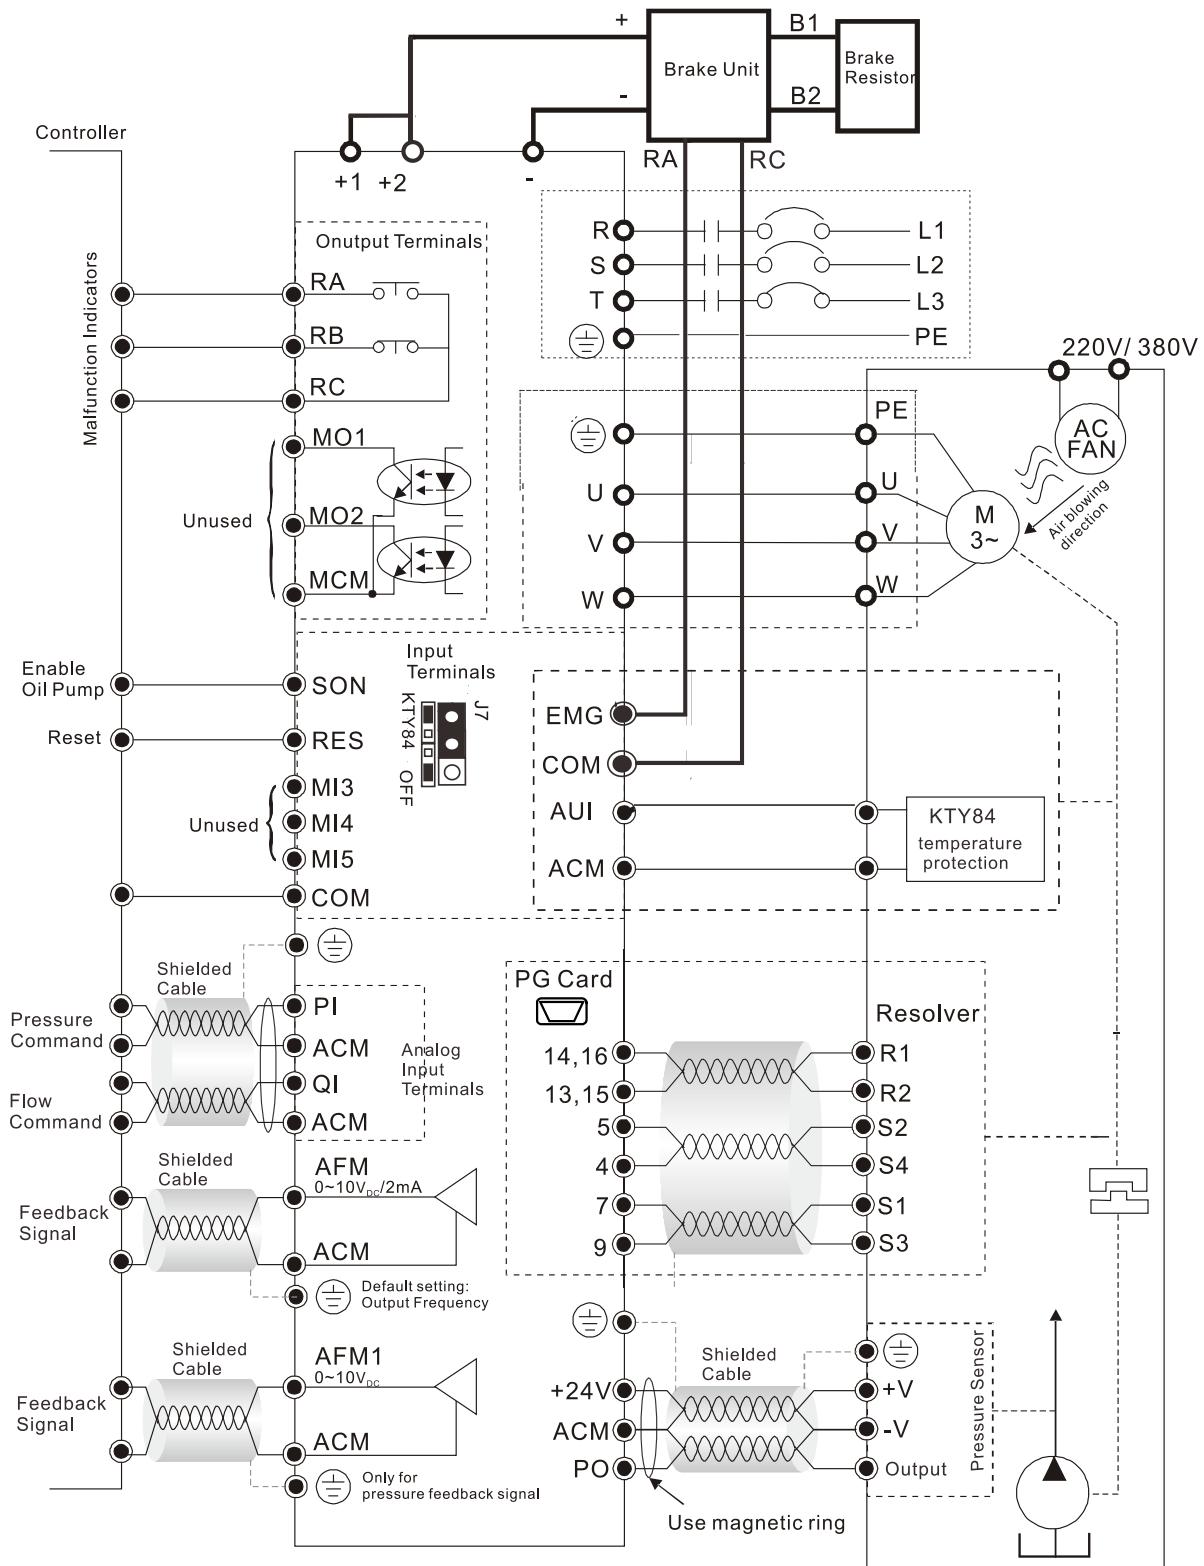

# Wiring

## Fan Cooled Type with Built-in Brake Unit (VFD-VJ-A / VFD-VJ-B Series)

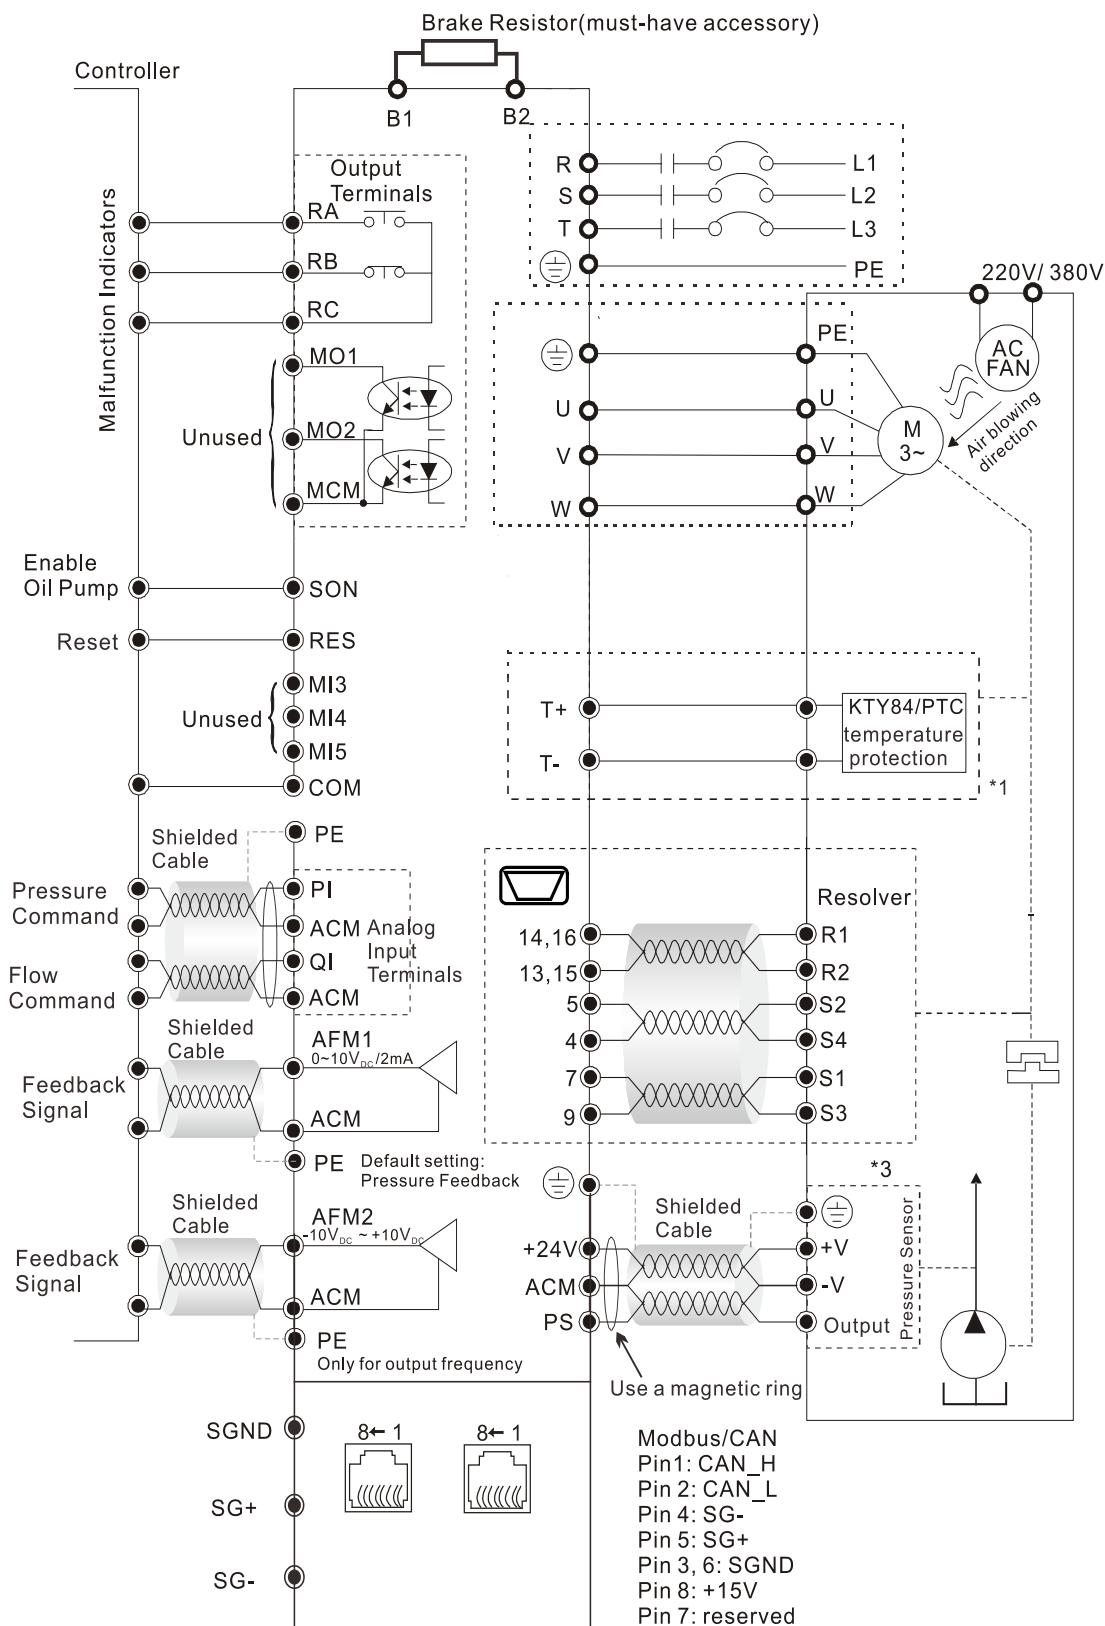

# Wiring

## Fan Cooled Type with External Brake Unit (VFD-VJ-A / VFD-VJ-B Series)

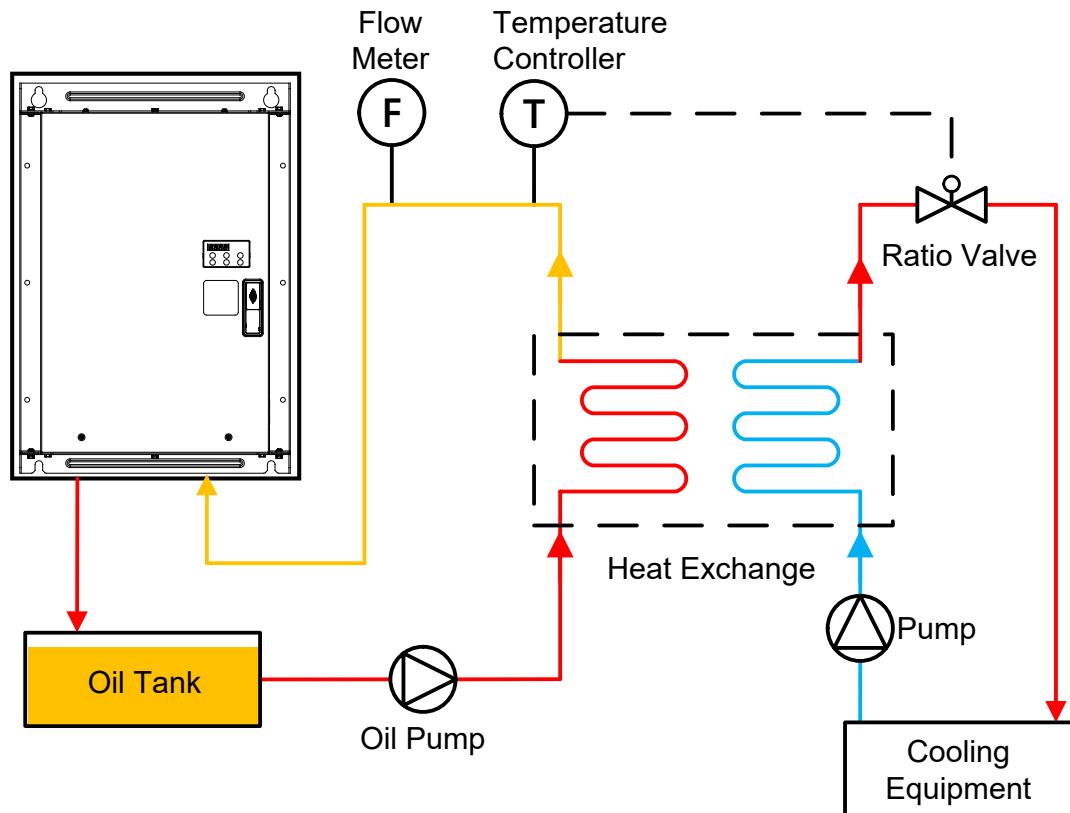

## Wiring

### Fan Cooled / Oil Cooled Types with Built-in Brake Unit (VFD-VJ-C Series)

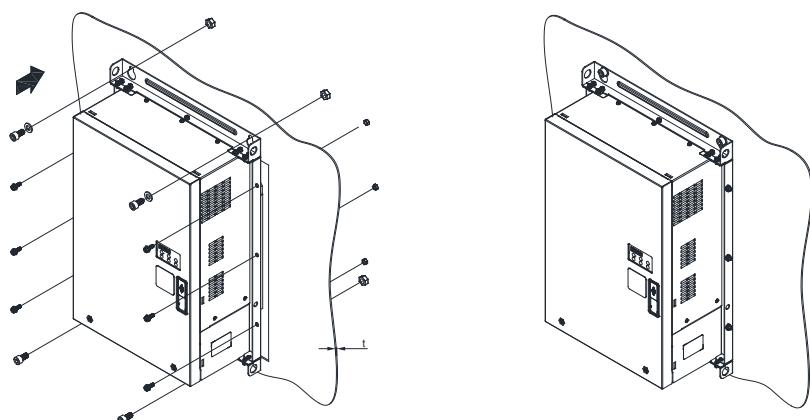

\* The KTY84 temperature sensor is used; be aware of the polarities. The colors of the motor encoder wire CBHE-E5M are: black/white for KTY-, red/white for KTY+, yellow/black for PTC, and yellow for PTC.

## Suggested Cooling System (Oil Cooled Type)

## Installation (Oil Cooled Type)

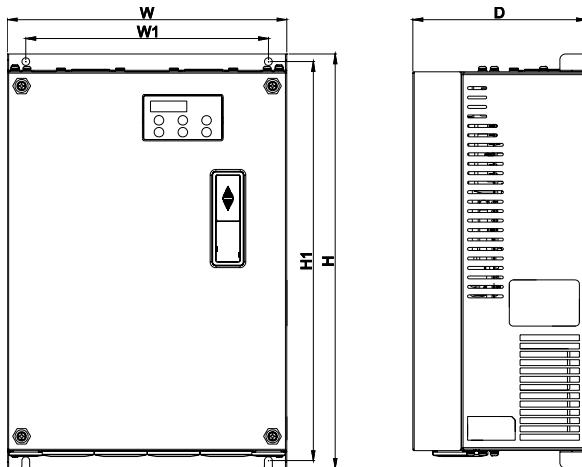

### Through-wall mount

- You can install the drive through the wall and fix it with 4 pieces of M10 screw and 6 pieces of M6 screw with screw nuts
- Suggested length of M10 screw L1 = wall depth(t)+ 16mm, torque: 200kg-cm[173.4 lb-in.]
- Suggested length of M6 screw L2 = = wall depth(t)+ 12mm, torque: 40kg-cm[34.7 lb-in.]

# How to Select the Right Hybrid Energy System

## (1) Motor Power Selection

|                        |  |                     |   |
|------------------------|--|---------------------|---|
| • Required torque (Nm) | $T = \frac{q \cdot \Delta p}{2\pi \cdot \eta m}$ | • Output power (kW) | $P = \frac{2\pi \cdot T \cdot N}{2\pi \cdot \eta m} = \frac{T \cdot N}{9,550} = \frac{Q \cdot \Delta p}{60 \cdot \eta t}$ |
|------------------------|--|---------------------|---|

|                          |                                       |  |
|--------------------------|---------------------------------------|--|
| q: Displacement (cc/rev) | n: Rotation speed                     | $\Delta p$ : Valid pressure difference (MPa) |
| Q: Required flow (L/min) | $\eta m$ : Pump mechanical efficiency | $\eta t$ : Pump total efficiency             |

## (2) Solution for Signal Interference

When the drive is installed at the control panel, protect against signal interference as follows:

- The wirings of main circuit and control circuit must be separate
- Proper grounding is required
- Use shielding cable for the control circuit
- Use metal pipe for the main power cable for the main circuit wiring

## (3) How to Choose a Suitable Hybrid Servo Drive and Motor

In the field application, the selection of hybrid servo drive and motor will be different due to different oil systems. In the following examples, a flow rate of 64L/min and a max. holding pressure of 17.5 MPa are used.

- **Displacement of hydraulic pumps:** get the displacement of hydraulic pump (cc/rev) from max. system flow (L/min)

**Example:** Assume that max. system flow is 64L/min. and max. motor speed is 2000rpm, the displacement of hydraulic pump will be  $64/2000*1000=32$ cc/rev

- **Max. motor torque:** get the max. torque from max. pressure and the displacement of hydraulic pump

**Example:** Assume that the max. pressure is 17.5MPa and the displacement of the hydraulic pump is 32cc/rev. The torque will be  $17.5*32*1.3/(2\pi) = 116$ Nm (the factor 1.3 is for compensation of total system losses and it can be changed to 1.2-1.3 as required)

- **Rated motor torque and rated motor power:** The required torque for the holding pressure at the max. pressure should be double the rated motor torque or less (use the data provided from the motor manufacturer as the first priority). Note that the motor temperature in this situation may easily overheat. Assuming that we choose double of rated torque, the motor can be 9.1kW\* with the rated speed 1500rpm when the rated motor torque is 58N-m.

\* Motor Power Formula:  $P(W)=T(N\cdot m)\cdot\omega(rpm\cdot 2\pi/60)$

- **Max. motor current:** If getting the torque constant  $k_t$  (Nm/A) =3.31 in the motor specification, max. current is about  $116/3.31=35$ A when the max. torque is 116N-m.

- **Select the right drive:** Please choose the right drive for the customers' requirement. Assume that the drive's overload is 150% for 60 seconds and 200% for 3 seconds. When the holding pressure is at max. pressure 17.5MPa with 32cc/rev hydraulic pump, the motor current it requires is 35A.

**NOTE** If none of the motors are suitable for your case, please choose motors with higher power range.  
Please contact Delta if you have any questions about the hybrid servo drive or integration with your current system.

- A. Using VFD075VL43A-J as an example: The rated current is 15.8A, and overload percentage is 220% (35/15.8\*100%), and the system will shut down within 1 second.  
B. Using VFD110VL43A-J as an example: The rated current is 21A, and overload percentage is 166% (35/21\*100%), and the system will shut down in 40~50 seconds.  
C. Using VFD150VL43A-J as an example: The rated current is 27A, and overload percentage is 130% (35/27\*100%), and the system will shut down in 60 seconds.

## (4) Select the Right Pressure Sensor

Optimum linearity with signal range 0~10V or 4~20mA.

## (5) Select the Right Shaft Coupling

Select the shaft coupling diameter to match the motor shaft diameter with good alignment and no clearance. It is recommended that you choose a flexible coupling or a rigid coupling.

## (6) Hydraulic Pumps

- Select the displacement for hydraulic pump that matches the required flow and motor speed
- If noise is the primary concern, a screw pump and an internal gear pump are both suitable for low-noise operation
- A piston pump fulfills the demand of high volumetric efficiency

- Commonly-used hydraulic pumps:

| Hydraulic Pump Types | Volumetric Efficiency | Flow Pulsation | Speed  | Noise  |
|----------------------|-----------------------|----------------|--------|--------|
| Internal Gear Pump   | Low                   | Medium         | Medium | Low    |
| Piston Pump          | High                  | Low            | Low    | High   |

\*1. 125% Brake Torque comes from (kw)\*125%\*0.8. Because of the resistor consuming power limit, the longest operation time of 10% ED is 10 seconds (on: 10 seconds / off: 90 seconds)

\*2. Resistors below 400W need to be fixed on the shelf for cooling purposes, and the surface temperature needs to be below 250 °C. Resistors above 1000W need to keep the surface temperature at below 350 °C.

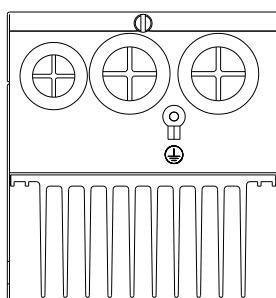

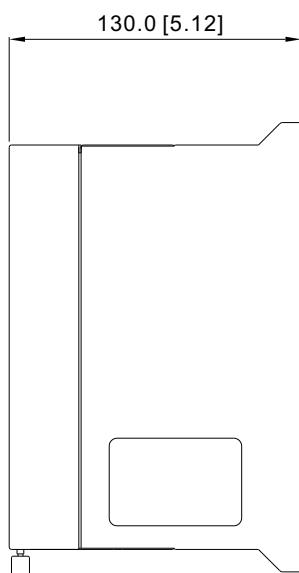

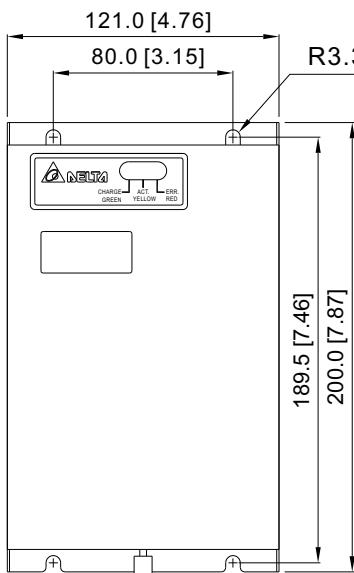

\*3. Please refer to the user manual of VFD-VJ-B Brake Unit for more details.

\*4. SC = Series Connection. PC = Parallel Connection.

\*1: This chart states the maximum operation speed of a motor with no field-weakening control. If field-weakening control is applied, the maximum operation speed of a motor is 2500rpm.

\*2: Users are required to set the parameter Pr.02-11 and Pr.02-09 Temperature Alarm (default 130 °C) when you use the KTY84-130 temperature sensor for motor overheating protection.

\*3: Users are required to set the parameter Pr.02-11=2 when you use the PTC130 thermistor for motor overheating protection.

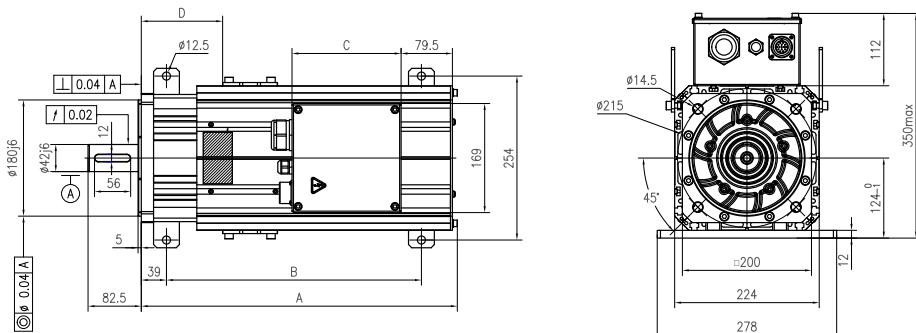

\*4: Encoder cable (CBHE-E5M, 5m) is included in the motor package.

\*5: Delta reserves the right to use revised specifications without prior notice.

\*1: High efficiency operating point with stable status and less temperature rise (< 80° C) than the Chinese standard (100° C). Strict and stable thermal states are required for electric current and effectiveness.

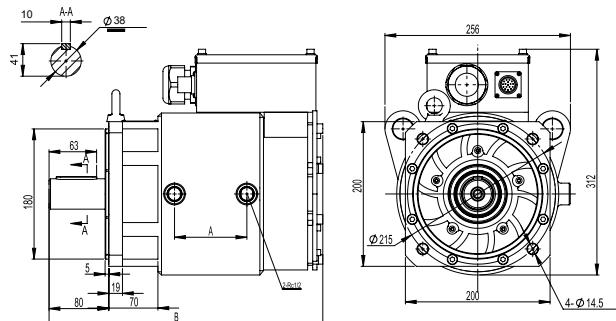

\*2: Periodical torque overloads at 1700 rpm: Twice larger than the rated power at the maximum. The actual maximum torque depends on operations; 250% is the practical maximum but last only for a short period of time. Please refer to the overload chart of T-N Curves.

\*3: The actual maximum speed depends on motor field-weakening control. 2500 rpm is a suggested value, not a limit.

\*1: This chart states the maximum operation speed of a motor with no field-weakening control. If field-weakening control is applied, the maximum operation speed of the motor is 2500rpm.

\*2: Users are required to set the parameter Pr.02-11 and Pr.02-09 Temperature Alarm (default 130 °C) when you use the KTY84-130 temperature sensor for motor overheating protection.

\*3: Users are required to set the parameter Pr.02-11=2 when you use the PTC130 thermistor for motor overheating protection.

\*4: Encoder cable (CBHE-E5M, 5m) is included in the motor package.

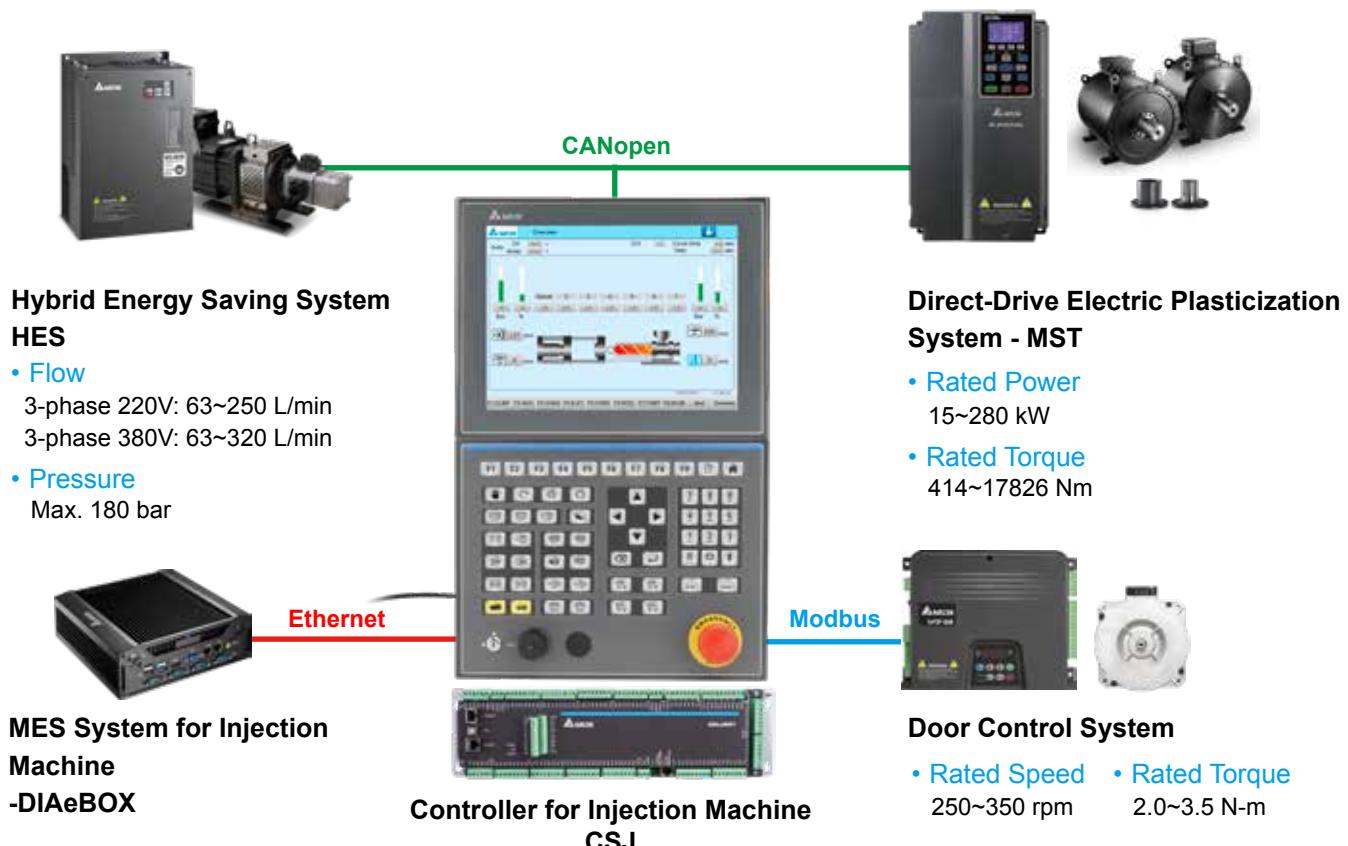

\*5: Delta reserves the right to use revised specifications without prior notice.

# Hybrid Electric Solution for Injection Molding Machines

Delta presents the Hybrid Electric Solution for Injection Molding Machines. The solution adopts the Control Unit for Injection Machine CSJ Series as controller, and connects the Hybrid Energy Saving System, Direct-drive Torque Motor MST Series, and Door Control Drive DD Series via communication. The integrated solution simplifies the system structure. The production data can be monitored and managed on Delta MES System for the Injection Machine DIAeBox.

## Features

- Connects the master controller, servo drive and motor via CANopen for real-time communication
- Exclusive user interface for the HES system control & monitoring and parameters adjustment
  - Obtains the optimized parameters for different actions of the hydraulic drive system
  - Seamless integration with Delta drives
  - Component lifetime alarm and maintenance notice
  - Enhancement of Overall Equipment Effectiveness (OEE)
- Delta equipment integration and one-stop after-sales service
- Remote VPN monitoring with a messaging software for real-time trouble shooting
- Supports standard Ethernet communication to connect peripheral equipment and achieve equipment IoT

\* Delta reserves the right to modify specifications without prior notice.

Smarter. Greener. Together.

## Industrial Automation Headquarters

### Taiwan: Delta Electronics, Inc.

Taoyuan Technology Center  
No.18, Xinglong Rd., Taoyuan District,  
Taoyuan City 33068, Taiwan  
TEL: +886-3-362-6301 / FAX: +886-3-371-6301

## Asia

### China: Delta Electronics (Shanghai) Co., Ltd.

No.182 Minyu Rd., Pudong Shanghai, P.R.C.  
Post code : 201209  
TEL: +86-21-6872-3988 / FAX: +86-21-6872-3996  
Customer Service: 400-820-9595

### Japan: Delta Electronics (Japan), Inc.

Industrial Automation Sales Department  
2-1-14 Shibadaimon, Minato-ku  
Tokyo, Japan 105-0012  
TEL: +81-3-5733-1155 / FAX: +81-3-5733-1255

### Korea: Delta Electronics (Korea), Inc.

1511, 219, Gasan Digital 1-Ro., Geumcheon-gu,  
Seoul, 08501 South Korea  
TEL: +82-2-515-5305 / FAX: +82-2-515-5302

### Singapore: Delta Energy Systems (Singapore) Pte Ltd.

4 Kaki Bukit Avenue 1, #05-04, Singapore 417939  
TEL: +65-6747-5155 / FAX: +65-6744-9228

### India: Delta Electronics (India) Pvt. Ltd.

Plot No.43, Sector 35, HSIIDC Gurgaon,  
PIN 122001, Haryana, India
